# Gzip Directory and Subdirectories | Guide

*Learn how to use gzip on a directory and subdirectories. Our [Server Management Support](#) team is here to help you with your questions and concerns.*

## How to use gzip on a directory and subdirectories

Gzip is a popular file compression utility. It helps reduce the size of files and directories by compressing them into a single `.gz`` file.

Our experts would like to point out that gzip works for individual files, not directories. To compress entire directories, our experts recommend tar or combining the two.

## How to compress a folder with gzip

To compress a directory and its subdirectories, we can combine the tar and gzip commands as seen here:

```
Tar -z
```

This allows us to create compressed archives easily.

Now, let's take a look at the syntax of this command:

```
tar -zcvf [result-filename.tar.gz] [path-of-directory-to-compress]
```

Where:

- -z: It compresses the file or directory with gzip.
- -c: It creates a new archive.
- -v: It displays progress while creating the archive.
- -f: It specifies the desired filename or directory to compress.

For example, if we want to compress a folder called "customerdetails", we can run this command:

```
tar -zcvf customerdetails_compressed.tar.gz customerdetails
```

When we run this command with the ``-v`` option, we will be able to see a list of filenames as they are added to the archive. This gives us a closer look at the compression progress.

## How to Extract Compressed Files

Once we compress our directory with gzip, we can extract the contents. This is done with this command:

```
tar -xvzf [our-tar-file.tar.gz]
```

Where:

- -z: It decompresses the file or directory with gzip.
- -x: It extracts files from the archive. It also extracts specific files if mentioned.
- -v: It displays progress while extracting.
- -f: It specifies the input ``.tar.gz`` file.

## How to extract content to a custom directory

Furthermore, we can extract the contents to a custom directory by using the ```-C``` or ```-directory``` option in our extraction command.

For example:

```
tar -xvzf sandbox_compressed.tar.gz -C /target/directory
```

Here, the contents will be extracted to `/target/directory`.

## Conclusion

In brief, our [Support Experts](#) demonstrated how to use gzip on a directory and subdirectories.

### **PREVENT YOUR SERVER FROM CRASHING!**

Never again lose customers to poor server speed! Let us help you.  
Our server experts will monitor & maintain your server 24/7 so that  
it remains lightning fast and secure.
